Jacdac on the iPad: press to light up

Connect a Jacdac button and LED ring, then code your micro:bit from the iPad app

Before you start

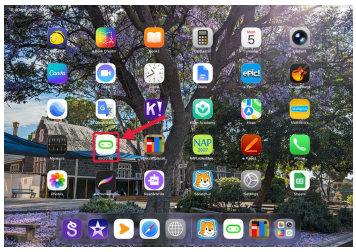

Slot the micro:bit into the **Jacdapter**. Plug the **button** and the **LED ring** into the Jacdapter with the Jacdac cables. Connect the **battery pack** to the micro:bit so it has power.

Every step below has a **red arrow** showing exactly what to tap.

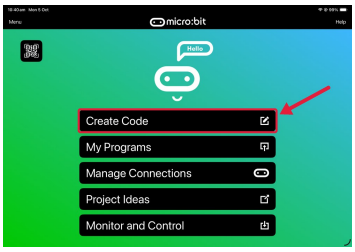

Steps

1 Open the app

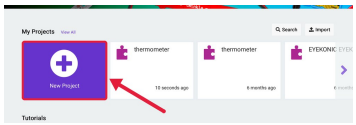

Tap the **micro:bit** app on the iPad home screen.

2 Create Code

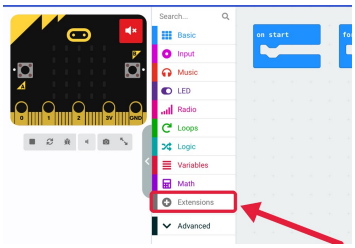

Tap **Create Code**. This opens MakeCode.

3 Start a new project

Tap the purple **New Project** tile. If it asks for a name, type **jacdac** and tap **Create**.

4 Open Extensions

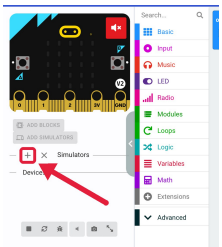

Tap **Extensions** near the bottom of the block menu.

5 Add the jacdac extension

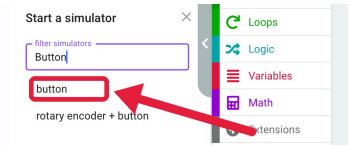

Type **jacdac** and tap **return**. Tap the yellow **jacdac** tile. A green **Modules** category appears.

6 Start a simulator

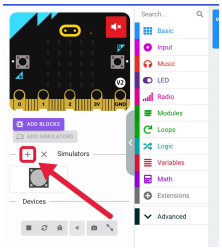

Under the micro:bit picture, tap the **+** next to **Simulators**.

7 Choose the button

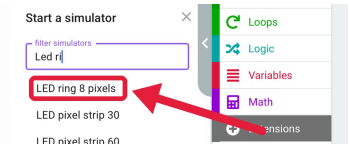

Type **button**, then tap **button** in the list.

8 Add one more

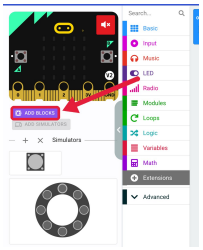

A button appears under Simulators. Tap the **+** again.

9 Choose the LED ring

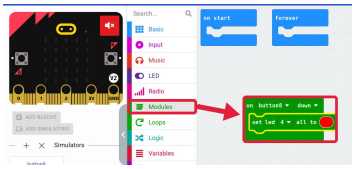

Type **led ring**, then tap **LED ring 8 pixels**.

10 Add the blocks

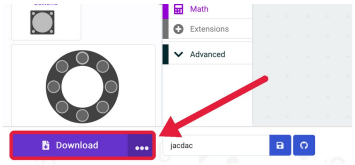

Tap **ADD BLOCKS**. This puts blocks for your button and LED ring into **Modules**.

11 Build the code

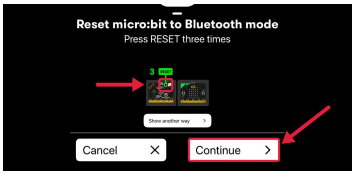

Tap **Modules**. Drag out **on button down**, then click **set led all to** inside it. Tap the colour to pick one.

12 Test, then Download

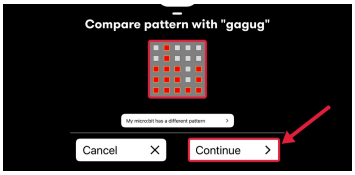

Tap the button in the simulator to test. When it works, tap **Download**.

13 Bluetooth mode

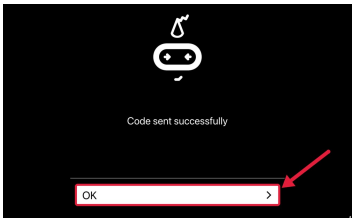

Press **RESET** on the back of the micro:bit **three times**, then tap **Continue**.

14 Check the pattern

Does the pattern match your micro:bit? If not, tap **My micro:bit has a different pattern** and copy yours. Tap **Continue**.

15 Try it for real

Tap **OK**. Now press your real Jacdac button. The ring lights up!

Different numbers? Your blocks might say **button1** or **led2** instead of button8 and led4. That is just the name MakeCode gave your module. Use whatever yours says.

Ring not lighting up? Check every cable has clicked in, the battery pack is switched on, and the set led block is **inside** the green button block.
